FORWARD

Recent months have seen an upsurge of interest in the physician's using more psychiatric knowledge in his day-to-day practice. An article in a medical journal once contained little more than an occasional pious and vague hope that the physician treating a certain medical or surgical condition would "consider and manage the associated emotional factors," whereas of late papers have often provided specific hints on the nature and management of those factors.

The effort to increase the family physician's psychiatric effectiveness has also involved the creation of special training courses. Both family physician and psychiatrist know that the complex skills required to manage emotions related to medical and surgical illness cannot be learned from a text-book, journal, or incidental lecture alone, nor are they born full blown from the good intentions of a loving doctor. As a result, family physicians have come to demand serious postgraduate training.

First one and then another psychiatric group in clinic, hospital, medical school, and elsewhere have risen to this demand with training courses of varying length, complexity, and hue. In the virtual absence of an academic tradition, each teaching group has started anew when deciding on course content and methodology of teaching. The result of this variegated approach has been the accumulation of a broad and valuable trial-and-error teaching experience---an accretion process that is continuing at a rapid rate today. Increasingly information and teachers' opinions distilled from this experience are found in medical periodicals and books.

The National Library of Medicine in Washington, D.C., detecting interest in education of the family physician, took the initiative to provide some background writings, and in a short time extracted and annotated from a substantial list of journals and books the bibliography that follows. The bibliographic entries have been listed under categories found useful by many of those engaged in physician education. But since this is a new field of education, many of the papers listed are quite general and comprehensive. For this reason, the reader will find much categorical material contained in articles listed in the general section of the bibliography. Presumably, as work in this field continues, more papers and books will appear dealing exhaustively with specific aspects of the problem.

The group of psychiatrists planning a course for family physicians, the student-physician desiring to broaden his course work by outside reading, the isolated physician without access to a psychiatrist teacher, and the many others seeking to enhance their own or others' sophistication in psychiatric principles and techniques will find this bibliography a valuable aid.

American Psychiatric Association
General Practitioner Education
Project

PREFACE

This bibliography lists books and articles written specifically to aid the non-psychiatric physician in recognizing and managing the mental and emotional disorders he encounters in his practice. It is neither an exhaustive nor an inclusive list. The criterion for selection was the author's intent: the instruction in basic psychiatry of the non-psychiatric physician for application to daily practice. Since library catalogs and indexes often do not bring out such intent, many works have probably been overlooked; nevertheless it is hoped that the list will prove a useful approach to a rapidly growing literature.

The books and journal articles listed are all in English, and except for a few especially useful ones, have all been published since 1957. They are arranged in broad categories, but since many articles contain material on several subjects, there is much overlapping. Descriptive annotations are quoted from the articles themselves. Section VII contains material on the teaching of psychiatry to non-psychiatrists, with reports of individual teaching experiences, as well as discussions of methodology.

TABLE OF CONTENTS
